

FLOUR MILLS

The BUG FREE GRAINS Solution for Milling Operations

Effectively treating and preventing insect infestations in your milling operation is a key measure in protecting your profitability.

Insects such as Indian meal moths, red flour beetles and confused flour beetles are persistent pests in flour mills where grains are processed, and often infest stored grain products. As they feast on the grains, they leave behind broken kernels and grain dust — and can contaminate your production process with insect parts and other detritus.

Protect Against Infestations with Diacon® IGR

Diacon® IGR is approved for use on all grains, spices, feeds and seeds, including commodities for human and animal consumption. The active ingredient in Diacon® IGR, (S)-methoprene, is an insect growth regulator with a long residual that interrupts the insect life cycle. Considered a biochemical pesticide, (S)-methoprene interferes with the insects' life cycles and prevents them from reaching maturity or reproducing, rather than controlling target pests through direct toxicity.

Adding Diacon® IGR to incoming grain can protect it from insect-related contamination and damage, preserving its quality and helping to ensure your profits are not impacted. In addition to treating raw commodities, Diacon® IGR may also be used in processing facilities as a fogging concentrate or surface spray for the treatment of insect pests.

YOU CAN HELP PREVENT INSECT INFESTATIONS WITH A S.L.A.M. STRATEGY

- **Sanitation** – prior to storage, clean the storage facilities and handling equipment thoroughly and spray with a tank mix of Diacon® IGR and Centynal™ Insecticide
- **Loading** – load grain with Diacon® IGR, allowing for circulation
- **Aeration** – properly cool the stored grain, keep it level rather than peaked
- **Monitor** – watch for early signs of infestation and sample regularly

FLOUR MILLS

Control Infestations, Prevent Contamination and Economic Damage with Diacon® IGR

The active ingredient in Diacon® IGR, (S)-methoprene, has a different mode of action than other insecticides: it prevents the larvae of nuisance insects from maturing into adults, interrupting their life cycles to help prevent infestation. Diacon® IGR can be used on all stored grains, spices, feed and seeds, including those used for animal and human consumption.

DIACON® IGR

A versatile liquid formulation that is excellent for control of Indian meal moths, red flour beetles, confused flour beetles and other stored product insects.

- Cost-effective, long-term control
- EPA tolerance exempt
- Established CODEX clearance
- Stable at high heat
- No withdrawal or holding period; Treated commodities may be processed immediately

HOW TO USE DIACON® IGR

- Apply directly to incoming grain stream
- A simple spray tank and nozzle system can be used for application
- Position nozzle over flowing stream of grain and calibrate according to rate of grain movement
- Refer to label for application rates

KNOW THE ENEMY

INDIAN MEAL MOTH

Plodia interpunctella

Larvae produce dense webbing that binds to food fragments; adult insects flying in vicinity of feed.

RED FLOUR BEETLE

Tribolium castaneum

Can cause damage by feeding, but primarily causes damage by contamination.

CONFUSED FLOUR BEETLE

Tribolium confusum

Foul odor and taste in infested feed; presence of adult insects, shed skins and fecal matter.
